### Project Structure

### TkInter

## Essential principle

Any element of a layer depends (calls code) only on other elements in the same layer or on elements of the layers beneath it.

- Partition a complex program into layers.
- Develop a design within each layer that is cohesive and that depends only on the layers below

# Responsibilities

## Lecture 11

Lect. PhD.  
Arthur Molnar

Layered  
architecture

Responsibilities

Entities

Value Objects

Data Transfer  
Objects

Files

## Presentation Layer

- User Interface - Responsible for showing information to the user, collect information from the user, and interpreting the user's commands

# Responsibilities

## Lecture 11

Lect. PhD.  
Arthur Molnar

Layered  
architecture

Responsibilities

Entities  
Value Objects  
Data Transfer  
Objects

Files

Text files  
Object  
serialization with  
Pickle

Inheritance

Case Study I -  
File Repositories  
Case Study II -  
Exception  
hierarchies

Project  
Structure

TkInter

## Middle Layer

- Controller - The first object beyond the UI layer that receives and coordinates ("controls") a system operation.
- Entities - Responsible for representing concepts of the business
- Repositories - Provide methods to add and remove objects, will encapsulate the actual insertion or removal of data in the data store. Provide methods that select objects based on some criteria and return

# Responsibilities

## Lecture 11

Lect. PhD.  
Arthur Molnar

Layered  
architecture

**Responsibilities**

Entities

Value Objects

Data Transfer  
Objects

Files

Text files

Object  
serialization with  
Pickle

Inheritance

# Entities

## Lecture 11

Lect. PhD.  
Arthur Molnar

Layered  
architecture

Responsibilities

**Entities**

Value Objects

Data Transfer  
Objects

Files

Text files

Object  
serialization with  
Pickle

Inheritance

Case Study I -  
File Repositories

Case Study II -  
Exception  
hierarchies

Project  
Structure

TkInter

- **Entity** - an object that is not defined by its attributes, but rather by a thread of continuity and its identity.
- If an object represents something with continuity and identity, it is something that is tracked through different states (or even across different implementations) it is an entity

# Entities

## Lecture 11

Lect. PhD.  
Arthur Molnar

Layered  
architecture

Responsibilities

**Entities**

Value Objects

Data Transfer  
Objects

Files

Text files

Object  
serialization with  
Pickle

Inheritance

Case Study I -  
File Repositories

Case Study II -  
Exception  
hierarchies

Project  
Structure

TkInter

- Entities are defined by identity and continuity
- Attributes of the entity may change but the identity remain the same
- Mistaken identity can lead to data corruption.
- Define what it means to be the same thing

## Demo

Examine the source code of the **Student** class in the problem domain (**ex25\_studentManagement.zip**).

# Value Objects

## Lecture 11

Lect. PhD.  
Arthur Molnar

Layered  
architecture

Responsibilities

Entities

**Value Objects**

Data Transfer  
Objects

Files

Text files

Object  
serialization with  
Pickle

Inheritance

Case Study I -  
File Repositories

Case Study II -  
Exception  
hierarchies

Project  
Structure

TkInter

- Many objects have no conceptual identity. These objects describe some characteristic of a thing
- An object that represents a descriptive aspect of the domain with no conceptual identity is called a **VALUE OBJECT**.
- When you care only about the attributes of an element of the model, classify it as a **VALUE OBJECT**

# Value Objects

## Lecture 11

Lect. PhD.  
Arthur Molnar

Layered  
architecture

Responsibilities

Entities

**Value Objects**

Data Transfer  
Objects

Files

Text files

Object  
serialization with  
Pickle

Inheritance

Case Study I -  
File Repositories

Case Study II -  
Exception  
hierarchies

Project  
Structure

TkInter

- The **Address** class in the Student Management app represents an example of Value Object
- When you specify the *county*, *city* and *street*, you already know everything about the object.
- **Other examples** of value objects: *Money*, *Location*, *Date*.
- **Generally** - any objects that represent the same thing when their attributes have the same value

## Demo

Examine the source code of the **Address** class in the problem domain (**ex25\_studentManagement.zip**).

# Entities vs. Value Objects

## Lecture 11

Lect. PhD.  
Arthur Molnar

Layered  
architecture

Responsibilities

Entities

**Value Objects**

Data Transfer  
Objects

Files

Text files

Object  
serialization with  
Pickle

Inheritance

Case Study I -  
File Repositories

Case Study II -  
Exception  
hierarchies

Project  
Structure

TkInter

## Discussion

- **Student** is an entity
- **Address** is a value object

Why isn't Student a value object?

# Entities, Value objects and Repositories

## Lecture 11

Lect. PhD.  
Arthur Molnar

Layered  
architecture

Responsibilities

Entities

**Value Objects**

Data Transfer  
Objects

Files

Text files

Object  
serialization with  
Pickle

Inheritance

Case Study I -  
File Repositories

Case Study II -  
Exception  
hierarchies

Project  
Structure

TkInter

- Cluster the **entities** and **value objects** into **aggregates** and define boundaries around them.
- Choose one **entity** to be the root of each aggregate, and control access to the objects inside the boundary using the root.
- Allow external objects to hold references to the root only.
- **e.g.** - only *StudentRepository*, **NOT** *AddressRepository*.

# Data Transfer Objects

## Lecture 11

Lect. PhD.

Layered  
architecture

Responsibilities

Entities

Value Objects

Data Transfer  
Objects

Files

Text files

Object  
serialization with  
Pickle

Inheritance

Case Study I -  
File Repositories

Case Study II -  
Exception  
hierarchies

Project  
Structure

TkInter

- **Data Transfer Objects (DTO)** are object used to carry data between processes.
- In the case where communication between processes is expensive (e.g. over the Internet), it makes sense to bundle up the data and send it in one go.
- DTO's have no behaviour, they only contain data, so should not require testing

**NB!**

Since our programs do not employ processes, we are not using DTO's exactly as intended. However, in real life you will find application layers on different machines/architectures.

# Data Transfer Objects

## Lecture 11

Lect. PhD.  
Arthur Molnar

Layered  
architecture

Responsibilities

Entities

Value Objects

Data Transfer  
Objects

Files

Text files

Object  
serialization with  
Pickle

Inheritance

Case Study I -  
File Repositories

Case Study II -  
Exception  
hierarchies

Project  
Structure

TkInter

## Demo

Example **ex25\_studentManagement.zip** uses the *StudentGrade* class as data transfer object when retrieving the Top5 students for a given discipline.

# Files

## Lecture 11

Lect. PhD.

Layered  
architecture

Responsibilities  
Entities  
Value Objects  
Data Transfer  
Objects

## Files

Text files  
Object  
serialization with  
Pickle

## Inheritance

Case Study I -  
File Repositories  
Case Study II -  
Exception  
hierarchies

Project  
Structure

TkInter

- The information on your computer is persisted using files.
- Files contain data, organized using certain rules (the file format).
- Files are organized in a hierarchical data structure over the file system, where directories (in most cases files, themselves) contain directories and files
- Operations for working with files: open (for read/write), close, read, write, seek.
- Files can be **text files** (directly human-readable) or **binary files**<sup>1</sup>.

---

<sup>1</sup>There's 10 types of people, some of whom directly read hexa ▶

# Files

## Lecture 11

Case Study II -  
Exception  
hierarchies

Project  
Structure

TkInter

## Common operations<sup>2</sup>

- Built in function: **open(filename,mode)** returns a file object.
- *filename* - string representing the path to the file (absolute or relative path)
- *mode*:
  - "r" - open for read
  - "w" - open for write (overwrites the existing content)
  - "a" - open for append
  - "b" - binary file (e.g. "rb" is read-mode, binary file)

---

TkInter

## Pickle is a Python module for saving/loading objects from a binary file<sup>3</sup>

- *load(f)* - load the data from the file
- *dump(object,file)* - write the *object* to the given file in pickle's own format
- In order to use Pickle, you must **f.open()** using "**rb**" and "**wb**" (read binary and write binary, respectively)

---

Project  
Structure

TkInter

- Classes can inherit attributes and behavior (i.e., previously coded algorithms associated with a class) from pre-existing classes called **base classes** (or superclasses, or parent classes)
- The new classes are known as **derived classes** or **subclasses** or child classes. The relationships of classes through inheritance gives rise to a hierarchy.

**NB!**

Inheritance defines an **is a** relationship between the derived and base classes.

# Inheritance for code reuse

Case Study II -  
Exception  
hierarchies

Project  
Structure

TkInter

- One of the motivations for using inheritance is the reuse of code that already exist in another class (implementation inheritance).
- Before the object-oriented paradigm was in use, one had to write similar functionality over and over again.
- With inheritance, behaviour of a superclass can be inherited by subclasses. It not only possible to call the overridden behaviour (method) of the ancestor (superclass) before adding other functionalities, one can override the behaviour of the ancestor completely.

# Inheritance in Python

Case Study II -  
Exception  
hierarchies

Project  
Structure

TkInter

- Syntax: **DerivedClassName**(BaseClassName)<sup>4</sup>:
- DerivedClass will inherit:
  - Fields
  - Methods
- If a requested attribute (field,method) is not found in the class, the search proceeds to look in the base class
- Derived classes may override methods of their base classes.
- An overriding method in a derived class may in fact want to extend rather than simply replace the base class method of the same name.
- There is a simple way to call the base class method directly: call *BaseClassName.methodname(self,arguments)*

## NB!

- The generalization relationship ("**is a**") indicates that one of the two related classes (the subclass) is considered to be a specialized form of the other.
- Any instance of the subtype is also an instance of the superclass.
- The generalization relationship is also known as the inheritance or "**is a**" relationship.
