- Each professor has appointed consultation hours every week
- This is the time and place to ask for extra help for the course
- There is no grading!
- In order to attend, send an email to your professor using your @scs username and get their confirmation before attending
- Schedule is at
<http://www.cs.ubbcluj.ro/studenti/tutoriat/orarul-consultatiilor/>

My consultation hours

Each Tuesday, in Campus C406, starting 14:00 (send email at least 24h beforehand!)

Test Driven Development (TDD)

TDD requires developers to create automated unit tests that clarify code requirements before writing the code.

- Steps to apply TDD¹:
 - 1 Create automated test cases
 - 2 Run the test (will fail)
 - 3 Write the minimum amount of code to pass that test
 - 4 Run the test (will succeed)
 - 5 Refactor the code

¹Kent Beck. *Test Driven Development: By Example*. Addison-Wesley Longman, 2002. See also Test-driven development. http://en.wikipedia.org/wiki/Test-driven_development

implementation

1 Create a test

- Define a test function (*test_f()*) which contains test cases written using assertions.
- Concentrate on the **specification** of **f**.
- Define *f*: name, parameters, precondition, post-condition, and an empty body.

A complete
procedural
implementation

- 2 Run all tests and see that the new one fails
 - Your program has many functions, so it will also have many **test functions**
 - At this stage, ensure the new **test_f()** **fails**, while previously written test function pass
 - This shows that the test is actually executed and that it tests the correct function

implementation

3 Write the body of function **f()**

- Writing the test before the function obliged you to clarify its specification
- Now you concentrate on correctly implementing the function code
- At this point, do not concentrate on technical aspects such as duplicated code or optimizations

Thoughts on
TDD and
refactoring

A complete
procedural
implementation

- 4 Run all tests and see them succeed
 - Re-run the test you created at step 1
 - Now, you can be confident that the function meets its specification

implementation

5 Refactor code

- **Code refactoring** is a "disciplined technique for restructuring an existing body of code, altering its internal structure without changing its external behavior"².
- **Code smell** is any symptom in the source code of a program that possibly indicates a deeper problem:
 - **Duplicated code**: identical or very similar code exists in more than one location.
 - **Long method**: a method, function, or procedure that has grown too large.

²Martin Fowler. *Refactoring. Improving the Design of Existing Code*. Addison-Wesley, 1999. See also <http://refactoring.com/catalog/index.html>

TDD and
refactoring
A complete
procedural
implementation

- You should only use it within test case functions
- It is followed by an expression that is evaluated to either True or False:
 - If it evaluates to **True**, program execution continues normally.
 - If it evaluates to **False**, program execution halts with an **AssertionError**

Thoughts on TDD

a function using
TDD

Thoughts on
TDD and
refactoring

A complete
procedural
implementation

- TDD is designed to take you out of the mindset of writing code first, and thinking later
- It forces you to **think** what each part of the program has to do
- It makes you analyse boundary behaviour, how to handle invalid parameters before writing any code

Thoughts on refactoring

Steps for writing
a function using
TDD

Thoughts on
TDD and
refactoring

A complete
procedural
implementation

- Eliminate duplicated code by creating a new function
- Make long functions simpler by ensuring that each function only does one thing!
- Rename variables to meaningful names
